

# Outdoor solar power supply belt material

## Overview

Solar panels are produced by welding individual cells together using blasts of hot air. The welding process exposes the solar cells and the conveyor belts to temperatures of 390°C (734°F). Other conveyor materials will warp or melt at these temperatures, but the high thermal expansion coefficient of stainless steel enables it to. A key feature of an automated solar panel manufacturing system is a specially designed vacuum conveyor that smoothly releases the solar panels to minimize handling at high temperatures. Because stainless steel is so. Metal belts retain their shape and last longer than plastic or fabric belts, enabling them to maintain maximum accuracy and product quality. Stainless.
