

Solar charging panels to power electrical appliances

Overview

There are charts and tables here you can use for guidance. You may skip to those if you want, but it is important that you learn how to calculate appliances wattage consumption. Homes and RVs use appliances in different ways so you have to figure out your total power usage. To find your monthly electrical. Now you have to calculate how many hours per day an appliance runs. A 100W stereo running for 2 hours day uses 200W ($100W \times 2 \text{ hours} = 200W$). A 1000W microwave that runs for 10. Make sure you include peak / surge watts in your calculations. A fridge may only use 700W running, but it needs those 2000W to get started. Include that wattage when determining how many solar panels you will use. In a word, yes, you need a battery. The more appliances you use, the more batteries you will need. Your usage determines how many will. As we stated earlier, 20-30 solar panels can produce 900-1000kwh per month, the average power consumption of an American home. But the number you need will also depend on a lot of.
